ENTERPRISE

Essential services for a secure, optimized digital journey

When investing in digital technology, companies are starting to regard security as an additional component to their investment in cloud.

A recent CioNet survey, commissioned by Aruba Enterprise to look at IT investment by CIOs and senior executives in 2021, supports this claim.

They confirmed that Cloud projects and cybersecurity represent the main items in cost tables, not so much in economic terms but in terms of quality.

Embracing Cloud for greater flexibility and resilience

Aruba has considerable experience both in designing and managing data centers and Cloud enterprise infrastructures, making it well qualified to provide fully customized solutions, delivered via a network of ANSI/TIA 942-B Rating 4 data centers, with the highest levels of resilience.

Facilities that meet, in a timely manner, national and European guidelines that companies, public administrations and supranational organizations must follow when adopting and using Cloud-based platforms.

Compliance with security regulations and data sovereignty requirements is of primary concern, looking increasingly towards cloud to become flexible and resilient, as well as adopting measures that guarantee scalability, interoperability, efficiency and business continuity.

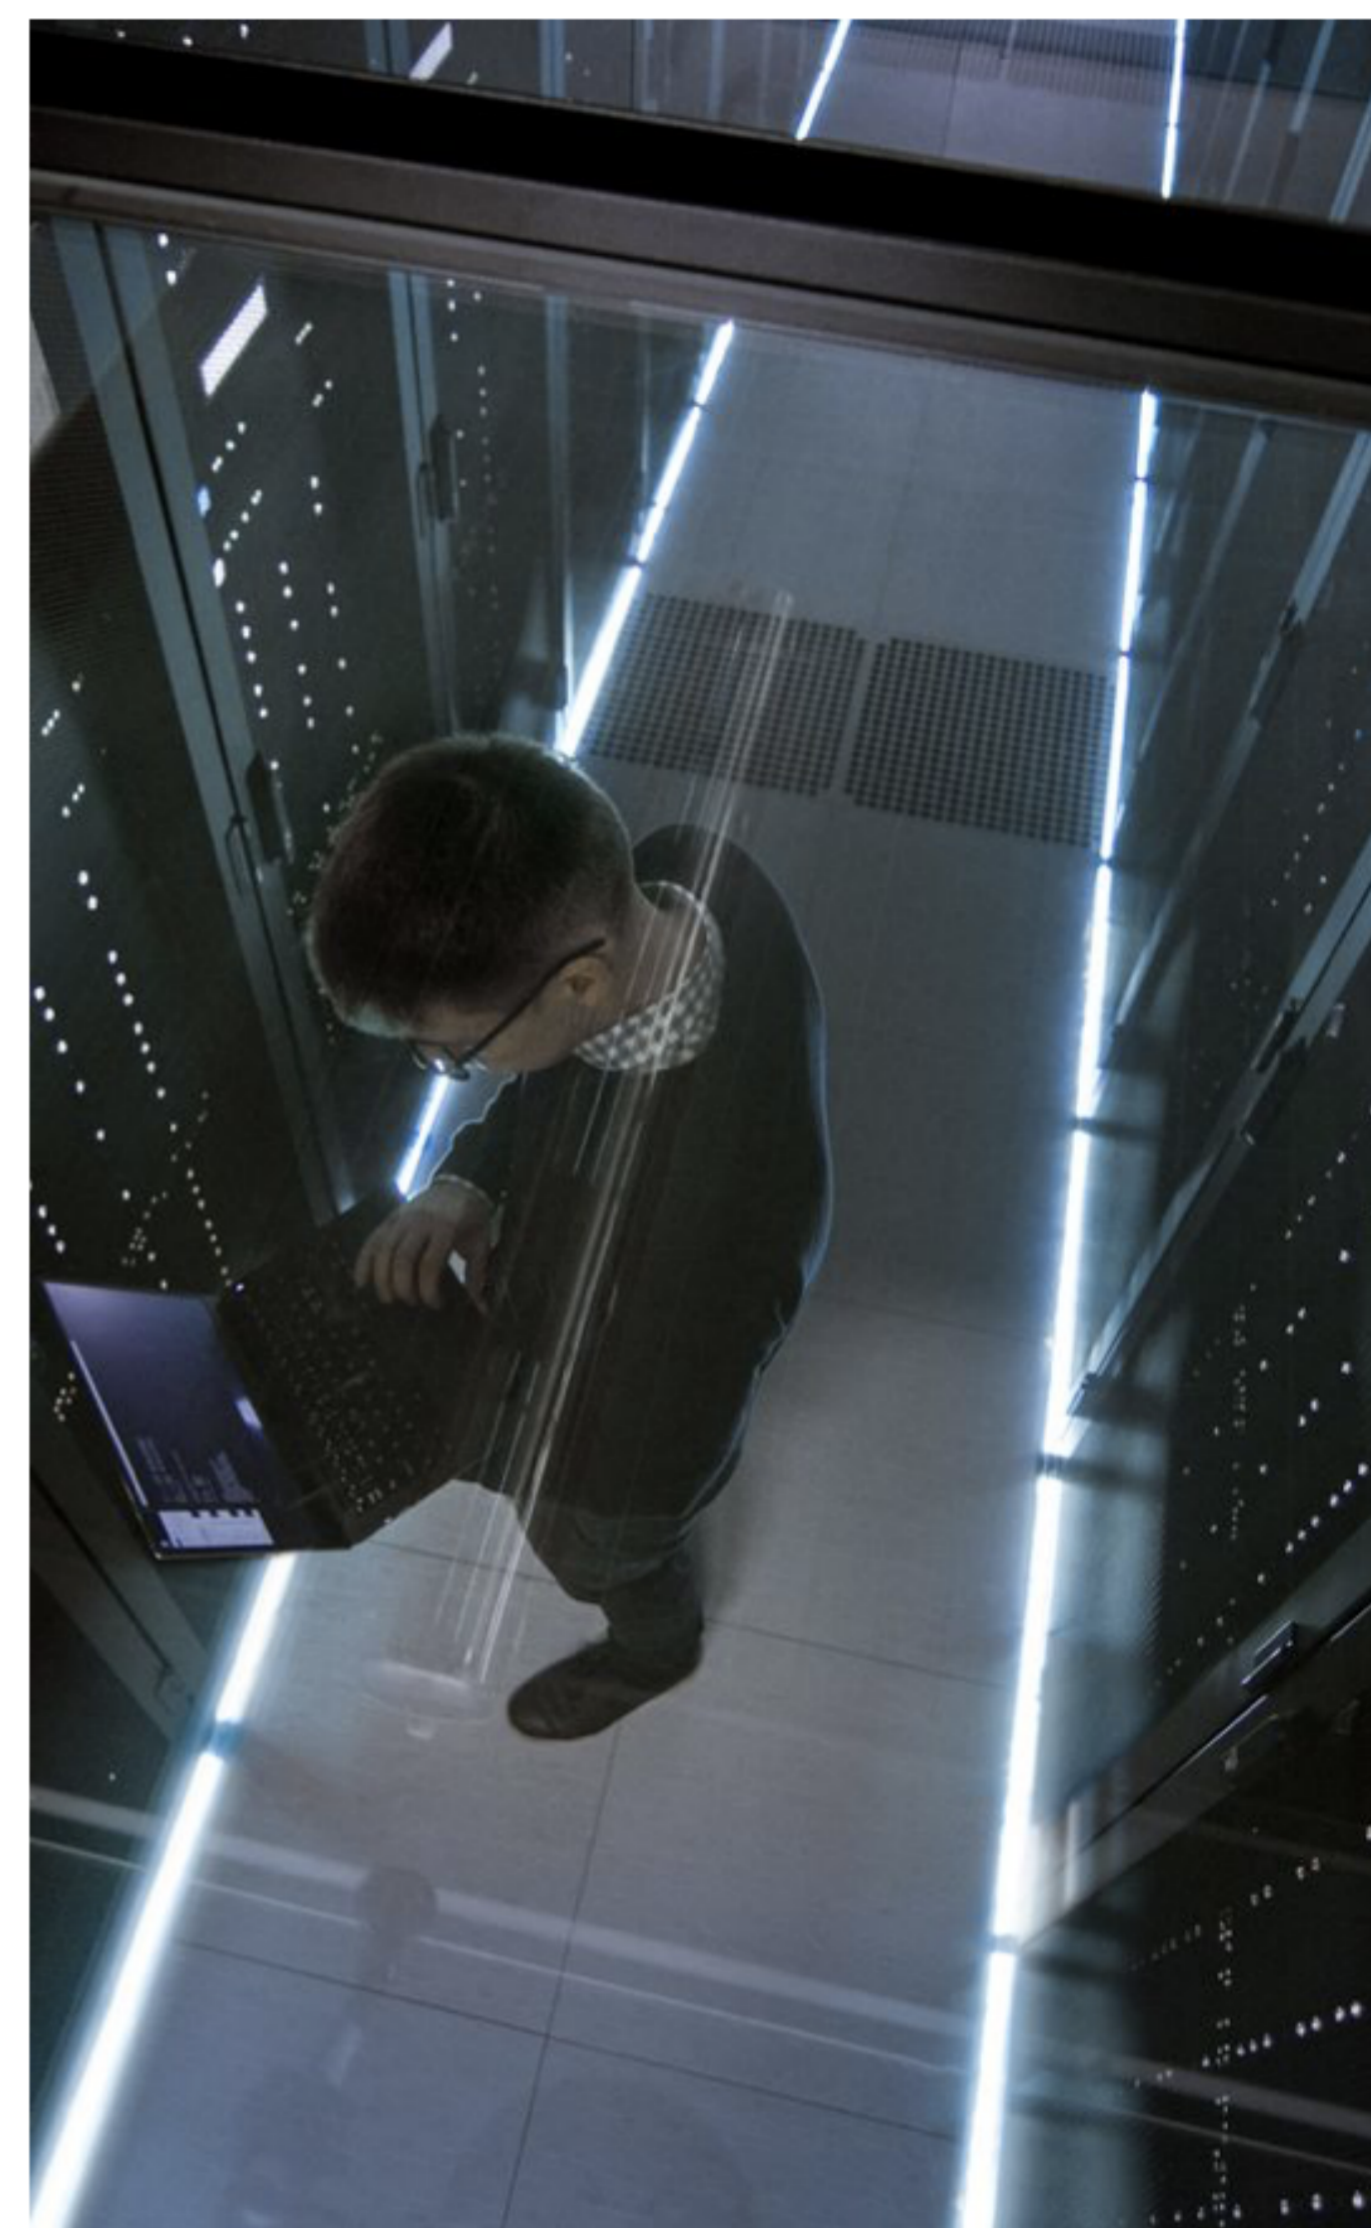

The importance of a Cybersecure Cloud

Robust security is critical for businesses making the move towards cloud.

That's why it's so important to work with IT partners able to offer skills and technology in the form of cloud infrastructures that can provide features such as scalability, interoperability, efficiency, service continuity and, last but not least, lower costs.

Cybersecure Cloud, provided through a partnership between Aruba and Leonardo, was created to fill this gap. It is designed to establish a comprehensive route towards a secure cloud solution based on an all-Italian supply chain; a route that incorporates the specific expertise of both companies to define solutions that can respond to the individual needs of each customer, guaranteeing compliance with Italian and European guidelines on data management and sovereignty, as well as with the security measures specified in the latest national and Community regulations.

INTEGRATED SOLUTIONS

Aruba and Leonardo - leading Cloud and Cyber Security services providers - combine their products, services and skills to become the new national reference point for secure digitization of Public Administrations, National Critical and Cyber Infrastructure, Industry and Defence.
